

## **ASME Process Water Heater**

For industrial applications, all voltages, single or three phase up to 88 kW

Stainless steel ASME Section VIII stamped pressure vessel provides maximum longevity and quality

Heavy duty construction withstands demanding industrial use

Packaged with all electrical operating controls for efficient installation

- Easy to service when replacing a part no other part needs to be removed
- Small reserve capacity lowers peak power demand and reduces operating costs in systems with ON/OFF cyclical demand
- Most units are easily upgradable for future expansion
- A full range of styles, sizes and optional features are readily available to meet your exact heating needs

### Applications

Washing/cleaning systems, OEM packages, heat transfer systems, freeze protection, sanitizing systems, process heating, water treatment systems.

#### A reliable industrial process water heater

The Hubbell Process V is a dependable and trouble-free water heater in continuous, cyclical or variable flow systems. The Process V has a stainless steel ASME stamped pressure vessel that resists the corrosive effects of hot water and provides maximum longevity. We use high quality materials and components to ensure reliable operation in even the most demanding application. The Process V is ready for immediate installation and service and all electrical operating controls are factory selected, sized and wired.

#### Over 100 years of water heating expertise

Hubbell water heaters are the right choice for your commercial and industrial applications. We have water heating solutions for most energy sources with storage capacities from 1–10,000 gallons — all designed, engineered, and manufactured for reliability and longevity coupled with unparalleled support and service.

# 🔥 HUBBELL

# Why Install A Hubbell Industrial Grade Water Heater?

#### Reliability

The Hubbell Process V heater is designed to provide many years of operation. The tank is all stainless steel construction and is engineered, constructed and stamped in strict conformance to ASME Section VIII.

#### **Lower Operating Costs**

The pressure vessel used in the Hubbell Process V is encapsulated in environmentally friendly CFC/HCFC free closed cell foam insulation to minimize stand-by heat loss. This high quality insulation reduces heat loss by more than half when compared to fiberglass type insulation.

#### **Advanced Construction**

- Trouble-free system integration, operation, and maintenance
- Digital temperature control
- Adjustable from 32–194°F (0°–90°C) with adjustable temperature differential
- Includes a float type low water cut off to prevent the heating elements from dry firing
- Internal leak detection sensor notification if water is present in the control cabinet
- For ease of service and maintenance, when a component is removed for service no other component needs to be removed
- All sensing functions are integrated into one probe
- Heating element and sensing probe are straight thread screw types that utilize a Viton O-ring to minimize leakage problems

All sensing functions are integrated into one probe which can be replaced without draining the tank

BELL

Brushed stainless steel exterior increases life and resists corrosion

Magnetic contactor Resettable circuit breakers (on units over 120 amps) replace one-shot fuses

Closed cell foam insulation lowers operating costs

Single point power connection-

Leak detection system notifies the user if water is detected inside the control area

Electronic control module integrates all control functions into one component

ASME stamped 304L stainless steel tank for extended life

Screw plug elements simplify service

Digital display provides visual set point and fault conditions. Operator controls are easily accessible including ON/OFF, reset, and temperature adjustment **HUBBELL**

### **Pressure Drop Charts**

Rated Voltage	Applied Voltage	De-Rating Factor
600	575	92%
600	550	84%
480	460	92%
480	440	84%
240	230	92%
240	220	84%

**Voltage De-Rating Factors** 

When the actual supply voltage (applied voltage) is different than the design voltage (rated voltage) the resulting kW output will be affected. Please see the chart for typical voltage de-rating factors or use the following formula.

 $\frac{\text{Applied Voltage}^2}{\text{Rated Voltage}^2} \text{ X Rated kW} = \text{kW output at applied voltage}$

# 🔥 HUBBELL

# **Process V Sizing Information**

### Versatile and Cost reducing design

#### In a continuous flow application...

with a constant flow of water the Hubbell Process V operates similar to an instantaneous, on-demand heater with the kW sized to meet the full GPM flow rate and temperature rise of the system.

#### In an Intermittent flow application...

with an ON/OFF cyclical demand (as in wash and rinse systems) the Process V will heat to the desired GPM flow

rate and temperature while reducing your peak power load. This is achieved due to the small reserve capacity of the Hubbell Process V which continues to be heated during the cycle OFF period in order to meet the full demand during the cycle ON period. This feature results in a significant reduction in your peak power consumption rate, increased temperature accuracy, and lower installation and operating costs when compared to an instantaneous heater.

**IF** the application is a continuous demand at a constant GPM then go directly to the recovery rate chart on page 8 and choose the appropriate kW which equals the flow rate at the desired temperature rise.

**IF** the application is an intermittent on/off cyclical system, the following steps will help determine the appropriate size Process V model

### Variables to Solve For:

Step 1: Determine the variables listed below. Step 3: Variables Gallons per cycle – Y (Variable 5) 1. Hot Water Flow Rate: \_\_\_\_\_ GPM x 1.15 = RGPM Time On x 0.80 Time hot water at above rate is required: \_\_\_\_\_ Minutes (Variable 2) 3. Time between usages: Minutes Step 4: 4. Total Cycle Time (Add #2 and #3) \_\_\_\_\_ Minutes (RGPM x Total Cycle Time) — Gallons Per Cycle  $\geq 0$ 5. Total Gallons used per cycle (#1 x #2) Gallons (Variable 4) (Variable 5) 6. Water Temperature: If true, then go to Step 6 °F Incoming Cold If false, then continue to Step 5 \_\_ °F Outgoing Hot Step 5: If 0 then use the following formula: Step 2: If variable #5 is between: Gallons per cycle (Variable 5) • 1–9 gallons then select V6 model and Y=5 x 1.15 = RGPM Total Cycle Time (Variable 4) 10–35 gallons then select V16 model and Y=13 Over 35 gallons see model D brochure for storage type Step 6: Take the RGPM value solved for either in Step 3 or Step 5 above and go to the recovery rating GPM or model CR brochure for large instantaneous Type DI water heaters. chart. Choose the appropriate temperature rise column and find a GPM rating equal or greater than

All information is subject to change without notice. Consult factory for submittal drawings.

hubbellheaters.com sales@hubbellheaters.com 203.378.2659

RGPM. Select the appropriate model for the voltage

and phase available.

**Example:** A parts wash station requires 4 GPM of 160°F DI water. The entering cold water is 60°F. The rinse cycle is on for 5 minutes at full flow and then off for 10 minutes. The power available is 480-volt 3 phase.

#### Step 1

Solve for variables

- 1. Flow Rate: 4 GPM
- 2. Cycle Time On: 5 Minutes
- 3. Cycle Time Off: 10 Minutes
- 4. Total Cycle Time: 15 Minutes
- 5. Gallons Per Cycle: 20 Gallons
- 6. Cold Water: 60°F
- 7. Hot Water: 160°F

**Step 2:** Gallons per cycle is 20, therefore the V16 Base Model is used and variable Y=13

**Step 3:** 20 – 13 = 7 ÷ (5 x .80) = 1.75 x 1.15 = 2.0 GPM

**Step 4:** 2.0 x 15 = 30 - 20 = 10 > 0

Step 5: Not required because step 4 is true

**Step 6:** From the recovery rating selection chart go to the  $100^{\circ}F\Delta T$  column and select the kW that will provide at least 2.0 GPM as determined in Step 3.

In this case, select the 36 kW size and the V16 Model as determined in Step 2.

Specify Model V1636T4

**Note:** In comparison an instantaneous design would require a 58 kW heater.

## **Packaged System Option**

#### **Fully Packaged Systems**

- Engineered and built to meet your exact needs
- Factory integrated system simplifies installation
- Factory selected components ensures reliable performance as a system

Contact Factory Sales Engineer to discuss your Packaged System

Left: A  $58kW 480V 3\Phi$  packaged system with dual hot water pumps and integrated SCR heater and pump control panel. Factory wired, piped, skid mounted and tested.

The Hubbell Process V also plays an important role in our Omni HHP Heat Pump System. For more information on the Omni HHP contact sales@hubbellheaters.com
